Cooperating with

U.S. Department of Agriculture
Agricultural Marketing Service
and

National Agricultural Statistics Service

ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA, National Agricultural Statistics Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetables, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

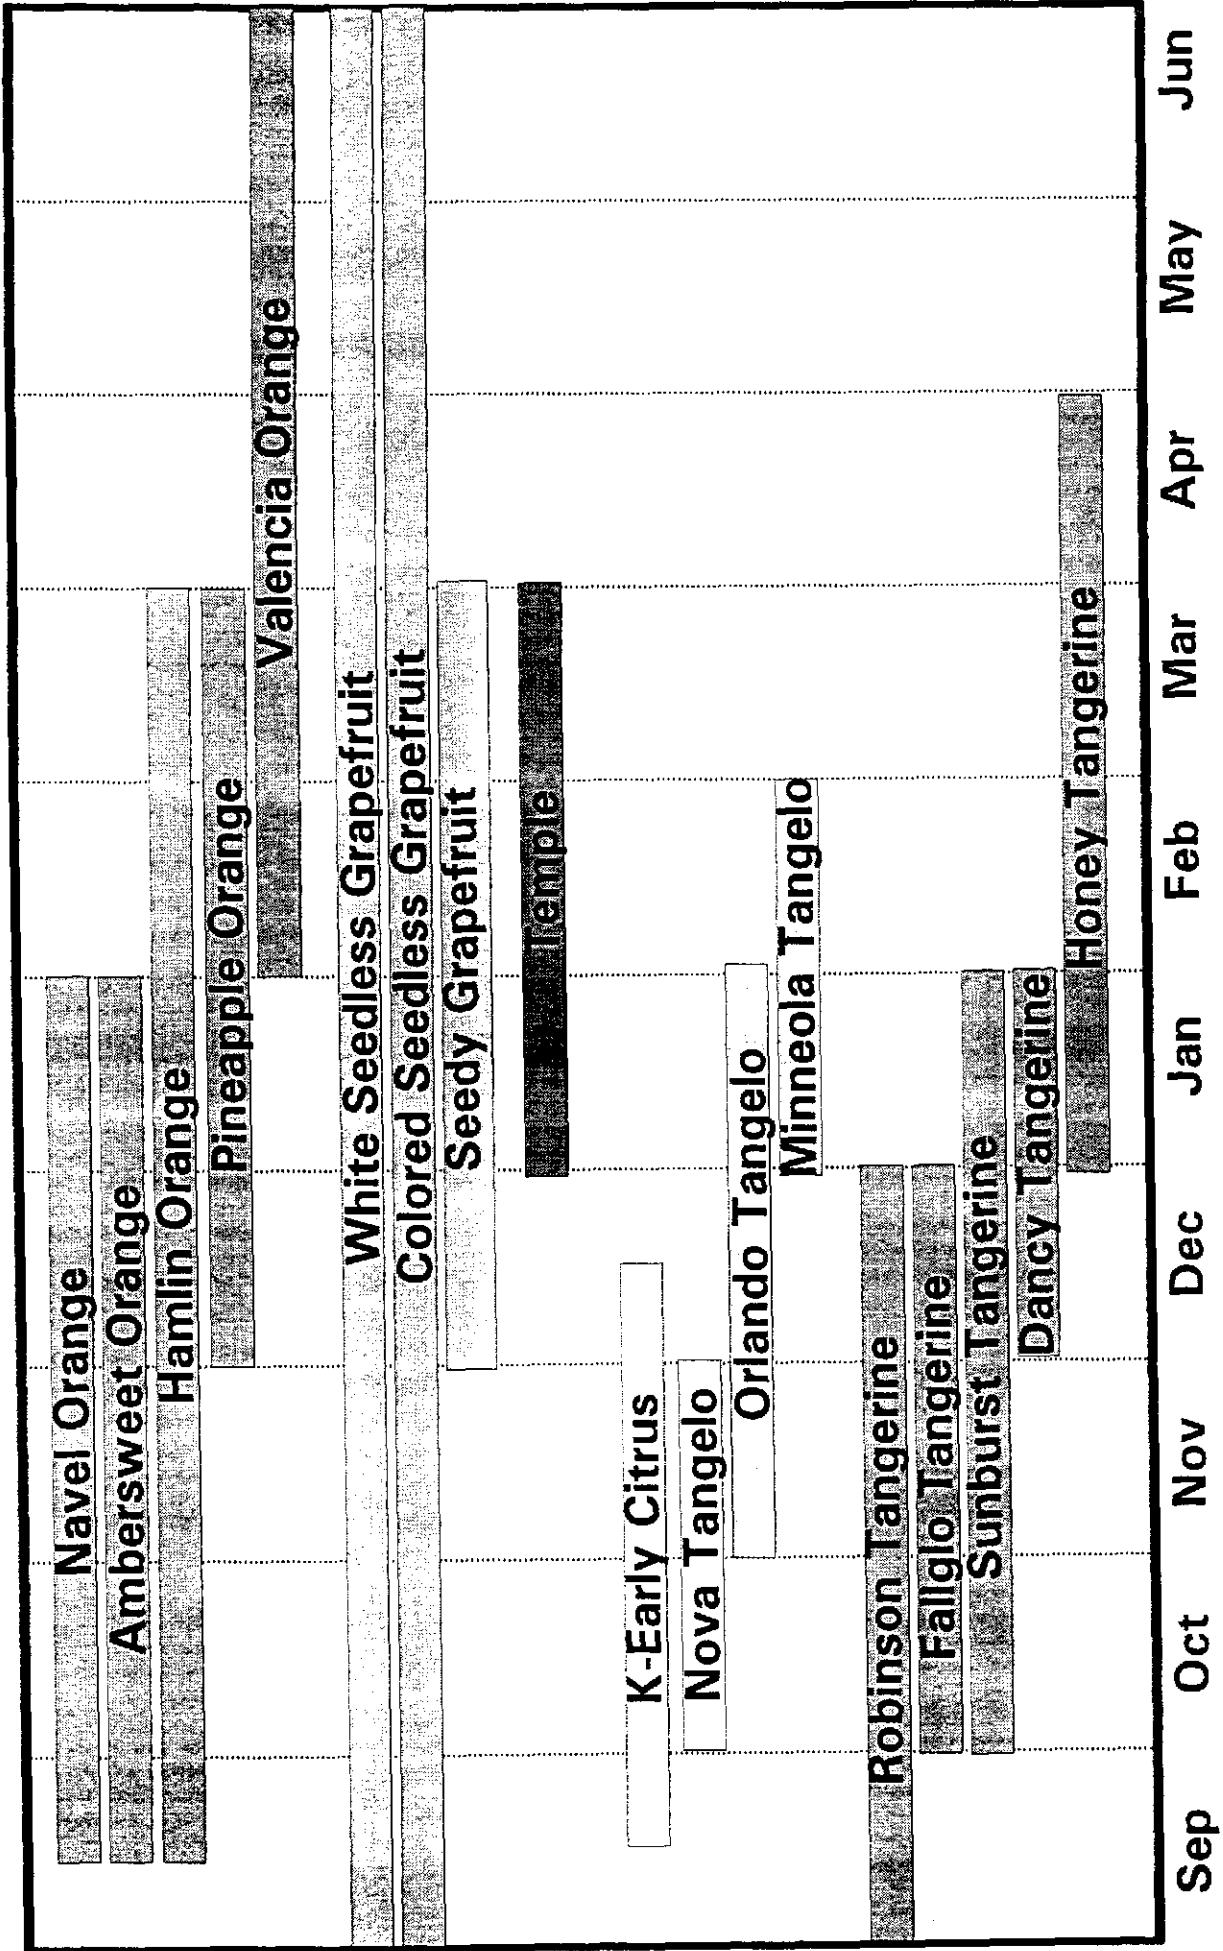

This report was assembled under the direction of Robert R. Terry, Candice T. Erick, and Rhonda L. Johnson of the Florida Agricultural Statistics Service.

For additional information call (407) 648-6015 or visit this office's website at <http://www.nass.usda.gov/fl>.

FLORIDA CITRUS HARVESTING SEASON

1995-96 SEASON HIGHLIGHTS

PRODUCTION

Florida produced 265,275,000 boxes of citrus in 1995-96, a decrease of two percent from the previous season. All orange production was down one percent; smaller Valencia and Navel crops were nearly offset by early-midseason oranges setting a production high by exceeding the 1994-95 record. Grapefruit averaged a six percent decrease with the white seedless crop the lowest since 1991-92 and seedy tying the record low of 1993-94. While down two percent, the colored seedless crop is second only to the record high of 1994-95.

Harvested limes, still below the pre-Hurricane Andrew level, increased for the second consecutive season. Lemon production was down 25 percent and the tangelo crop was the smallest since 1968-69. Comparing the last 33 seasons, this Temple crop exceeds only the freeze damaged crop of 1989-90. Substantial increases in production were recorded for K-Early citrus fruit and each of the tangerine varieties with the Sunburst variety now accounting for nearly half of all tangerine certifications.

The Florida Citrus Processors Association reported the all orange FCOJ yield final at 1.52252 gallons of concentrate per box. The early-midseason portion of the crop was final at 1.44775. Although higher than those recorded in 1994-95, these yields are lower than those of the prior two seasons, the two highest on record. Valencia oranges produced 1.66979 gallons per box, an increase from 1994-95 and the third highest on record. In the record year 1992-93 all oranges were final at 1.57893 and early-midseason oranges reached 1.52480. The Valencia high of 1.69608 was recorded in 1991-92.

California's larger Navel and Valencia crops totaled 66.0 million boxes, an 18 percent increase over the previous season. The lemon harvest of 21.0 million boxes was five percent greater than the revised 1994-95 crop. Although bearing acreage for grapefruit increased slightly, the .81 million box crop was the smallest since the 1990-91 season.

Arizona's lemon crop rebounded 42 percent, nearly reaching the level of 1993-94. Orange production made a strong comeback reaching 1.65 million boxes. Grapefruit bearing acreage's downward trend continued and production, at 1.2 million boxes, decreased for the fourth consecutive season.

Bearing acres of Texas citrus increased this season. Even though production fell 12 percent to 940 thousand boxes of oranges, fresh shipments were the highest recorded since commercial production resumed in 1991-92. Harvested grapefruit at 4.55 million boxes was down slightly but the amount of processed fruit has increased for each of the past four seasons.

CITRUS BOX WEIGHTS: Approximate net weight in pounds by fruit type and states

States	Oranges	Grape-fruit	Tan-gerines	Lemons	Limes
FL	90 ^{1/}	85	95	90	88
CA	75	67 ^{2/}	75	76	—
TX	85	80	--	--	--
AZ	75	67 ^{3/}	75	76	—

^{1/} Includes Temples and tangos at 90 pounds.

^{2/} Was 65 pounds prior to the 1993-94 season.

^{3/} Was 64 pounds prior to the 1993-94 season.

VALUE

Surpassing \$1.1 billion, the preliminary on-tree value of the 1995-96 citrus crop exceeds the revised values of the previous three seasons. It is 24 percent greater than the revised 1994-95 value of \$905 million, lowest in a ten year series.

Preliminary value is based on that part of the crop priced at harvest, which amounts to all of the fresh fruit and about 40 percent of the processed. When all participation plans and cooperative pools are finalized, a revised value will be calculated.

Improved prices were recorded for the early-midseason oranges despite the record setting production. Excluding Navels, the weighted average price per box was \$3.44. The price of Navel oranges rose an average of 20 percent to \$5.21 and Valencias posted an even greater gain averaging \$6.24. Value of the orange crop was up 28 percent totaling \$940,319,000.

Prices were lower this season for colored seedless (\$1.71) and seedy grapefruit (\$1.63) but the white seedless price (\$2.28) was up slightly. Each of the seedless crops experienced an eight percent reduction in value. Seedy grapefruit's value, down 28 percent from the revised value for 1994-95, is the lowest in the 42 year series.

Prices and crop values were much improved this season for several of the specialty crops. Temples returned 42 percent more per box, the tangelo price was up 69 percent, early tangerines gained 33 percent, and the K-Early citrus fruit price rose 23 percent. Increased production offset lower average prices for limes and honey tangerines, resulting in greater values. Even though the average lemon price was higher, the value of the crop decreased with the smaller harvest.

The season average delivered-in price of fruit going into FCOJ reported by the Florida Citrus Processors Association was \$6.26 per box or \$1.01 per pound of solids. Early-mids averaged \$5.33 per box or \$0.90 per pound of solids, and late oranges averaged \$8.04 per box or \$1.21 per pound. Prices for fruit used in FCGJ averaged \$3.08 per box or \$0.70 per pound for white seedless and \$1.24 per box or \$0.28 per pound of solids for colored seedless grapefruit.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1985-86 through 1994-95

Crop year	Value 1,000 dol.	Crop Year	Value 1,000 dol.
1986-87	941,078	1991-92	1,208,944
1987-88	1,443,116	1992-93	855,812
1988-89	1,429,808	1993-94 ^{1/}	939,854
1989-90	952,303	1994-95 ^{1/}	904,977
1990-91	1,236,126	1995-96 ^{2/}	1,230,738

^{1/} Revised. ^{2/} Preliminary.

FOREIGN EXPORTS

Fresh fruit exports totaled 25.7 million 4/5 bushel cartons, up slightly from last season. Canada accounts for the most receipts of Florida oranges and specialty fruit while Japan receives the most grapefruit.

A total of 20.1 million gallons of FCOJ were exported, mostly to Canada. There were also 6.5 million gallons of FCGJ exported.

1995-96 FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS, AND MONTHS

During January and February of 1995, abundant moisture and cool temperatures provided excellent tree condition to withstand the temperatures in the upper 20's on February the 9th. Low temperatures were not of long enough duration to cause significant damage.

Warming temperatures in March helped trees produce new growth and bloom buds. At mid-month, swelling bloom buds were slowed by the return of more cold weather. Most trees were finally in full bloom by the end of March. The bloom period was completed around mid-April. This was the most normal bloom period in many seasons. There were several scattered rains and a few thunderstorms during April and May which provided adequate moisture for setting the new crop fruit.

In early June Hurricane Allison, which went on shore in the northwestern part of Florida, provided abundant rains to most citrus counties with no damage to citrus. Most of June and July was hot, humid, and generally tropical in nature which provided near-ideal growing conditions for the new crop of fruit.

On August 1 Hurricane Erin entered the State near Vero Beach with heavy rains and decreasing winds. The hurricane rapidly lost strength as it passed Orlando and exited the State near Pasco and Hernando counties. Causing very little damage, it deposited several inches of rain as it crossed Florida. Tropical Storm Jerry pelted the citrus belt with heavy rains and thunderstorms the last week of August. Some caretakers recorded up to a foot of rain. Most of the standing water was rapidly drained with only minimal resulting root damage in a few groves.

Harvest for the 1995-96 season began in early September with a few packing houses shipping Ambersweet oranges and red grapefruit. Movement of early fruit increased slowly through September and picked up volume in October. Heavy rains persisted through October which limited harvesting operations.

The cool and dry conditions of November were a welcomed relief from the wet weather which began in mid-summer. During November and early December harvesting

increased rapidly and most processors opened to receive grove-run oranges. Temperatures during December were below average. This cooler weather forced most trees into a quasi-dormant condition which would help minimize cold damage should freezing weather arrive.

Weather conditions during January 1996 were generally normal with a few light frosts and scattered showers preceding the cold fronts. The cold nights and cool daytime temperatures prevented new growth. Harvest of early and midseason oranges was very active with most processing plants running around the clock. Warm temperatures followed a light mid-February freeze to produce an abundance of new growth and a proliferation of bloom buds. Adequate moisture in virtually all areas of the citrus belt provided excellent growing conditions.

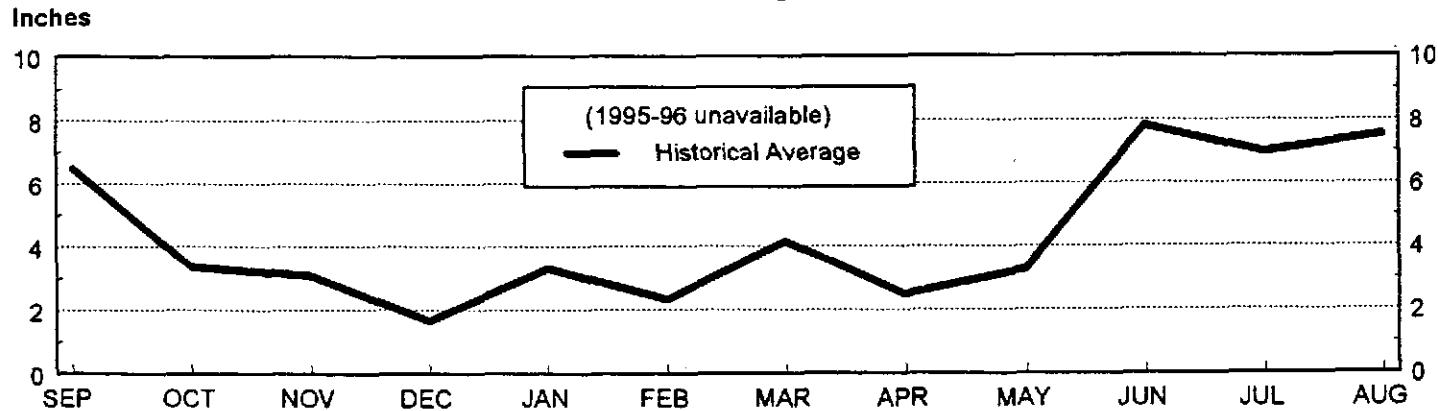

By mid-March there was full open bloom on trees of all ages in all citrus counties. The bloom cycle was completed by the 10th of April except for a few trees where the bloom lingered till mid-month. Groves and trees continued in very good condition with the help of irrigation to assure adequate surface moisture. Throughout April most groves produced new foliage on trees of all ages.

Generally dry weather prevailed during May into early June with only scattered showers which supplemented the industry-wide use of irrigation. By mid-June, regular summer rains were well underway and general grove conditions ranged from very good to excellent.

In early July, there were several drenching rains and thunderstorms that delivered up to and over five inches of rain. This additional rainfall helped replenish many of the lakes, ponds, and streams that were reduced during the usually dry spring months. The hot and humid weather during mid to late summer of 1996 provided near-ideal and tropical growing conditions for the new citrus.

Charted below is the historical average of monthly rainfall which includes data from two stations in each of the citrus producing areas. The ten stations are: Avon Park, Clermont, Clewiston (AG), Immokalee, Lake Alfred, Orlando, Plant City, Ruskin, Stuart, and Vero Beach (4W).

FLORIDA PRECIPITATION: Average monthly rainfall, ten selected stations,
1985-86 through 1994-95

PRICES

All prices reported in this publication are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing have been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average f.o.b. price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.

At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers. These preliminary figures for the season just ended, the revised figures for the previous season, and county production by type are released annually in late September.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for dropage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and dropage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for the individual counties.

TREE CENSUS

The Florida Agricultural Statistics Service first indexed the State's commercial citrus groves on aerial photography as of January 1966. Ground crews identify all the State's groves by fruit type, row spacing, and year in which set. Photo interpreters in the Orlando office then delineate the groves by variety blocks on photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The design of the inventory survey allows for quick and economical updating. Since 1966, the citrus belt has been resurveyed each second winter to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography are obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 1996. Through 1995, all types of citrus planted totaled 857,687 acres, up 0.5 percent from the 853,742 acres recorded in January 1994. Acreage declined in 15 of the 35 citrus counties since the previous census, but the Gulf Citrus area showed a slight acreage gain. For the second consecutive census a record number of trees are planted. The rate of new plantings slowed in 1994 and 1995, and only 11 percent of the 107.1 million trees are non-bearing.

Photographing for the next survey will begin in November 1997, and field work will update the acreage records as of January 1998.

^{1/} Includes shipments to Canada and Mexico.

SOURCE: See Page 47, Data Sources, Item 5.

Footnote 2/ for pages 31 and 32, footnote 3/ for page 33. Final Mexican shipments to the U.S. are reported by FAS as a combined total for oranges and tangerines. The totals shown on pages 31 through 33 have been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments through the U.S. to Canada are not included.

^{1/} Crop year refers to harvest and marketing period which usually begins in the fall and extends through the spring. This corresponds roughly to October-June in the Northern Hemisphere and April-December in the Southern Hemisphere. For the Southern Hemisphere, harvest occurs almost entirely during the second year shown. The harvest of lemons usually begins earlier and often extends throughout the year. ^{2/} One metric ton is equivalent to 2,204.6 pounds. ^{3/} Includes Temples. ^{4/} Includes small quantity of tangerines. ^{5/} Tangerine production is small and is included with oranges. ^{6/} Mainly satsumas (also called mandarin or unshu mikan), but also including mandarin hybrids. ^{7/} State of Sao Paulo only, which apparently accounts for over one-half of Brazil's production. About 120,000 tons of tangerines which are processed are included in the orange table. ^{8/} Includes tangelos, which account for about half of the total production. ^{9/} Clementines only.
